## Notes

- Counting: each flow-log tuple is one observation, so flows = observations (1 each). Bytes and packets are 0 for version 1 flow logs.

- Dedupe: an inbound allowed observation whose source is a storage-backed scope is skipped when that storage account was read in this run, because its outbound record is counted at the source NSG. Skipped: 0.

- Local files with offline topology: longest IPv4 prefix match. Unmatched public IPv4 is internet; private or non-IPv4 is unmapped.

- Port filter matches the destination port. IP filter matches the source or destination address. Min bytes applies per observation.

- Offline topology from topology.json: 3 network(s), 3 prefix(es).
